

Neutral Rust Remover

This product revolutionises the process of removing rust from cast steel and machined steel components.

It's neutral and non-classified formulation allows for safe inclusion within automated spray wash equipment where even heavy levels of corrosion can be removed in process times below 15 minutes.

Low temperature operation is a major cost improvement whilst safe disposal as a non-hazardous material massively reduces operating costs.

Long tank life once in use gives certainty of results with no exposure of personnel to the historically hazardous formulations that have been identified as injurious to the environment.

Neutral Rust Remover has huge potential within the automotive and rail remanufacturing industries. Engineering companies that normally face costly outside shot blasting can reduce re-work of essential components, in house, for a fraction of the cost per component, cutting out production delays and extra transport costs.

Packaging options available, 25 litre containers, 200 litre barrels and 1000 litre IBC (intermediate bulk containers)
